

# Security Viewer

## DataLan SharePoint Utilities

The security hierarchy in SharePoint can get very complex as the SharePoint environment grows. Over time it can become difficult to keep track of the various levels of inheritance and unique security set throughout the portal.

The **DataLan Security Viewer** allows administrators to generate an HTML report detailing the security rights make-up of all SharePoint sites within the portal environment. This report includes rights assignments at all levels as well as inheritance setting information.

**Features include:**

- Generation of security report for sites within the SharePoint environment.
- Report is organized by site hierarchy and allows for viewing of site group assignments and site group rights.
- Web-based information presentation for easy printing.
